

History Templates are used to define a set of pre-defined actions the system to log a change.

Create first Item type then not define the history template.

Then check get error.

Task 2 : Difference between Versionable and History Template :

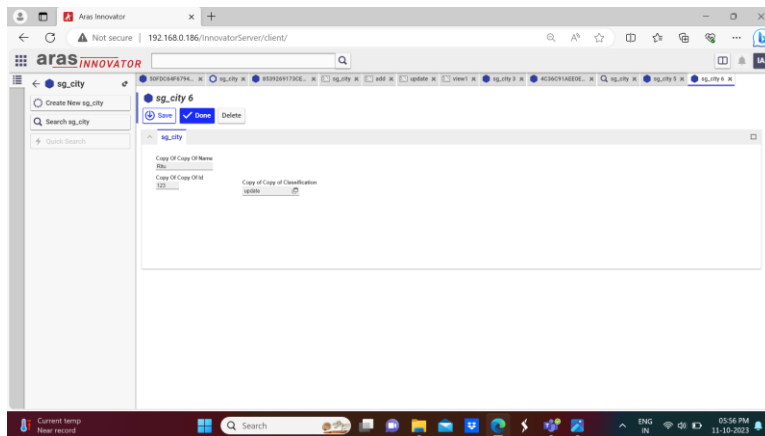

Versioning is a feature that allows you to track changes of data or a document over time.

When a file or data is versionable, it means that each time a change is made to it, a new version of that file or data is created.

A history template is typically a predefined or customized structure for recording and displaying historical information about an object, item, or record within a database or system.

It can include fields such as creation date, modification date, user responsible for changes, and specific attributes that need to be tracked.

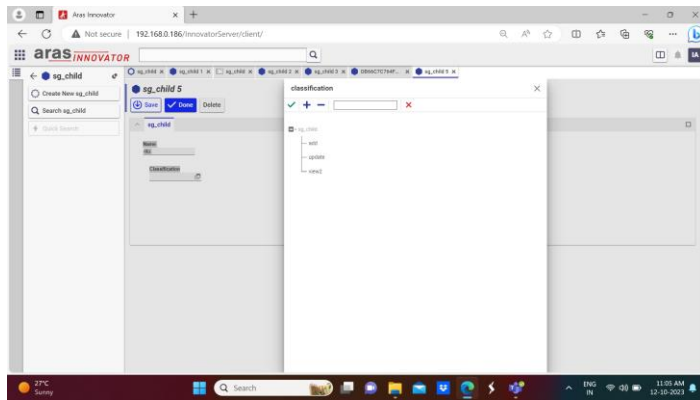

Task 3 : Class Structure

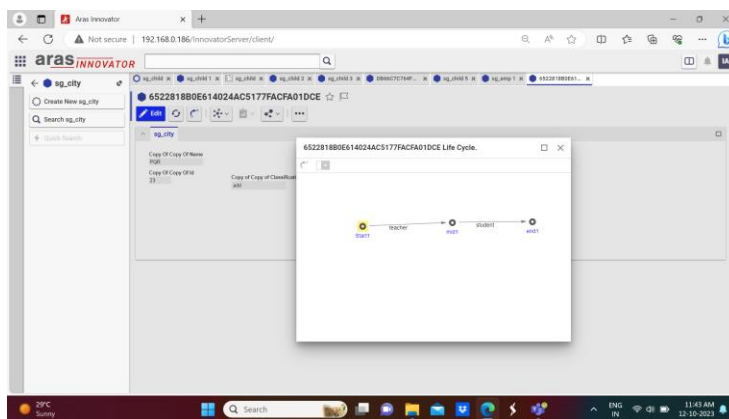

Click the class structure and create then add subclasses of item type

In views add classification. And add created class structure in form.

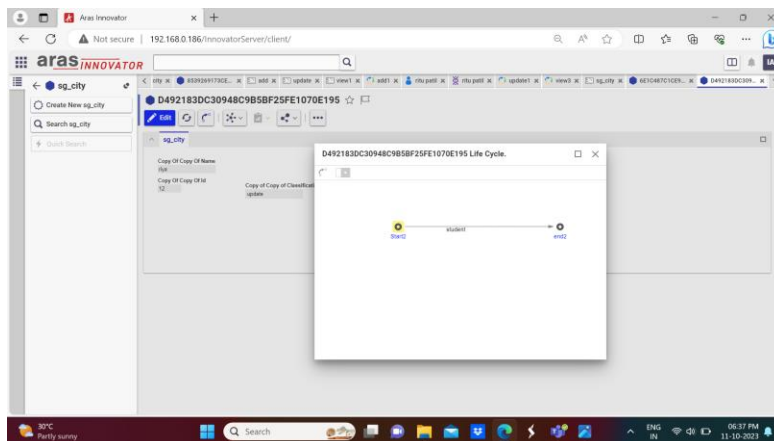

Add , Update ,View:

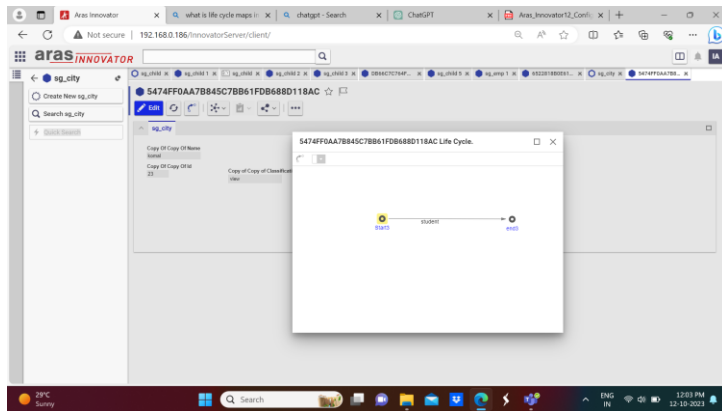

Life-Cycle :

This is add lifecycle .

This is update lifecycle.

This is view lifecycle.
